AMENDMENTS TO THE CLAIMS

1 (currently amended): An image projection system comprising:
5 a light source for generating a light beam;
a reflective housing comprising an opening, the reflective
housing forming an accommodating space, the light source
installed inside the accommodating space so that the light
beam generated by the light source substantially
10 propagates along an optical path through the opening away
from the accommodating space; and
an invisible-light reflector installed at a reflecting
position intersecting with the optical path outside the
opening of the reflective housing, a normal of the
15 invisible-light reflector and the optical path
intersecting to form a predetermined angle so that
invisible light of the light beam emitted from the opening
will be reflected back into the accommodating space[.];
wherein the predetermined angle formed by the normal of the
20 invisible-light reflector and the optical path is an acute
angle not equal to zero degrees, so that infrared rays of
the light beam reflected back into the accommodating space
by the invisible-light reflector will not focus on the
reflective housing.

25
2 (previously presented): The image projection system of claim
1, wherein the reflective housing is an elliptic reflective
housing, and the light source is installed at a focal point
of the elliptic reflective housing, and the optical path is
30 a major axis of the elliptic reflective housing.

3 (cancelled)

4 (currently amended): The image projection system of claim [[3]]

5 1, wherein the image projection system further comprising
a light tube connected to the light source, wherein the
infrared rays of the light beam reflected back into the
accommodating space by the invisible-light reflector will
not focus on the light tube.

10

5 (currently amended): The image projection system of claim [[3]]

1, wherein the acute angle is smaller than 45 degrees.

6 (previously presented): The image projection system of claim

15 1, wherein the image projection system further comprises an
image module, the image module comprising a plurality of
controllable optical reflectors for modulating the light
beam passing through the invisible-light reflector to
generate a projecting beam containing an optical image,
20 wherein the light beam passing through the invisible-light
reflector does not comprise the infrared rays.

7 (currently amended): The image projection system of claim 6,

25 wherein the image module is a digital micro-mirror device
~~or a liquid crystal panel.~~

8 (previously presented): The image projection system of claim

30 1, wherein the reflective housing is a parabolic reflective
housing, and the optical path is a parallel route by which
the light beam propagates after being reflected by the

parabolic reflective housing.

9 (currently amended): An image projection system comprising:
5 a light source for generating a light beam;
an elliptic reflective housing comprising an opening, the
reflective housing forming an accommodating space, the
light source installed inside the accommodating space so
that the light beam generated by the light source
10 substantially propagates along a major axis of the
elliptic reflective housing through the opening away from
the accommodating space;
an image module comprising a plurality of controllable
optical reflectors for modulating the light beam to
15 generate a projecting beam containing an optical image;
and
an invisible-light reflector installed between the
reflective housing opening and the image module and at
a reflecting position outside the opening of the elliptic
20 reflective housing at which the invisible-light
reflector intersects the major axis of the elliptic
reflective housing, a normal of the invisible-light
reflector and the major axis intersecting to form a
predetermined angle so that invisible light of the light
25 beam emitted from the opening will be reflected back into
the accommodating space[.];

wherein the predetermined angle formed by the normal of the
invisible-light reflector and the major axis is an acute
angle not equal to zero degrees, so that infrared rays of
30 the light beam reflected back into the accommodating space

by the invisible-light reflector will not focus on the
elliptic reflective housing.

5 10 (cancelled)

11 (currently amended): The image projection system of claim
[[10]] 9, wherein the image projection system further
comprising a light tube connected to the light source,
10 wherein the infrared rays of the light beam reflected back
into the accommodating space by the invisible-light
reflector will not focus on the light tube.

12 (currently amended): The image projection system of claim 9,
15 wherein the ~~acute~~ predetermined angle is smaller than 45
degrees.

13 (previously presented): The image projection system of claim
9, wherein the image module is a digital micro-mirror device
20 or a liquid crystal panel.

14 (previously presented): The image projection system of claim
9, wherein the light source, the reflective housing, and the
invisible-light reflector form an integral structure.
25

15-16 (cancelled)

17 (new): The image projection system of claim 1, further
comprising an image module, wherein the image module is a
30 liquid crystal panel.

Appl. No. 10/604,722
Amdt. Dated November 3, 2004
Reply to Office action of August 05, 2004

18 (new): The image projection system of claim 1, wherein the invisible-light reflector is immediately adjacent to the reflective housing along the optical path.

5

19 (new): The image projection system of claim 9, wherein the invisible-light reflector is immediately adjacent to the elliptic reflective housing along the major axis.
